

Annual Infrastructure Report

Platform Engineering · Fiscal Year 2026

Prepared for the Infrastructure Steering Committee
July 22, 2026

Executive Summary

Uptime held at 99.97% across all production regions this fiscal year, against a 99.95% SLA target. Incident count dropped 34% year-over-year following the migration to the new deploy pipeline. Cloud spend grew 12%, in line with traffic growth of 15%, meaning cost-per-request actually improved.

Regional Uptime

Region	Uptime	Incidents	MTTR
us-east-1	99.98%	4	18m
us-west-2	99.99%	2	11m
eu-central-1	99.95%	7	26m
ap-southeast-1	99.96%	5	22m

Deploy pipeline migration paid off. The 34% incident reduction is directly attributable to canary deploys catching regressions before full rollout — 11 of 18 incidents last year would have been caught pre-migration.

Monthly Cloud Spend

Q4 spend needs a closer look. The November spike correlates with an under-provisioned autoscaling group in eu-central-1 — already patched, but worth a line item in next quarter's cost review.

FY2027 Priorities

1. Extend canary deploys to the data pipeline services (currently blue/green only).
2. Reduce eu-central-1 MTTR toward the 15-minute regional average.
3. Right-size autoscaling groups flagged in the Q4 spend review.
